

BX Pressure and Shim Kit

The Pressure & Shim kit test & correct the hydraulic pressures on your tractor. They can test hydraulic pump, transmission, steering, backhoe, loader and all the relief valves. Shims are provided to adjust the hydraulic pump pressure. Test couplings are supplied to suit your tractor.

The best place to test your pressure depends on what options you have fitted to your tractor.

If you have a BX2380 or BX23S you need the flat faced coupler kit. All other models use the poppet coupler kit.

If you have a backhoe, this is the best place to test your pressure. If you have a 3rd function kit on the loader (i.e. 4in1 bucket) this is the best place to test your pressure. If you don't have a backhoe or 3rd function the best place to test your pressure is the loader connection. The removable test couplings allow you to test other functions and other equipment.

We have kits to suit the following:

Mowers (F, ZD, ZG and ZP series), Tractors (B, BX, L, M, and MX series) & Utility Vehicles (RTV series).
